Declaration of Conformity

FCC

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at own expense.

CE

The product(s) described in this manual complies with all applicable European Union (CE) directives if it has a CE marking. For computer systems to remain CE compliant, only CE-compliant parts may be used. Maintaining CE compliance also requires proper cable and cabling techniques.

Safety Precautions

- Read these instructions carefully before you install, operate, or transport the system.
- Install the system or DIN rail associated with, at a sturdy location
- Install the power socket outlet near the system where it is easily accessible
- Secure each system module(s) using its retaining screws
- Place power cords and other connection cables away from foot traffic. Do not place items over power cords and make sure they do not rest against data cables
- Shutdown, disconnect all cables from the system and ground yourself before touching internal modules
- Ensure that the correct power range is being used before powering the device
- Should a module fail, arrange for a replacement as soon as possible to minimize down-time
- If the system is not going to be used for a long time, disconnect it from mains (power socket) to avoid transient over-voltage

Service and Maintenance

- ONLY qualified personnel should service the system
- Shutdown the system, disconnect the power cord and all other connections before servicing the system
- When replacing/ installing additional components (expansion card, memory module, etc.), insert them as gently as possible while assuring proper connector engagement

ESD Precautions

- Handle add-on module, motherboard by their retention screws or the module's frame/ heat sink. Avoid touching the PCB circuit board or add-on module connector pins
- Use a grounded wrist strap and an anti-static work pad to discharge static electricity when installing or maintaining the system
- Avoid dust, debris, carpets, plastic, vinyl and styrofoam in your work area.
- Do not remove any module or component from its anti-static bag before installation

About This Manual

This manual introduces Neousys Nuvo-8208GC series featuring Intel[®] 8th/ 9th Gen Core[™] i hexa/ octa core 35W/ 65W LGA1151 processors and dual graphics cards. The Nuvo-8208GC system supports dual 250W NVIDIA[®] graphics cards for the advanced inference capabilities.

The guide also demonstrates the system's installation procedures.

Revision History

Version	Date	Description		
1.0	Jul. 2019	Initial release		•

1 Introduction

Nuvo-8208GC is powered by Intel® Xeon® E or 8th/9th Gen Core CPU and Intel® C246 chipset; it has powerful computing power to support dual 250W graphics cards. In addition to the dual x16 PCIe slots for GPU installation, Nuvo-8208GC has two other x8 PCIe slots and one x4 PCIe slot for expansion cards to extend function sets like data collection, analytics, and communication.

It accepts 8~48V wide-range DC input and handles heavy power requirements from dual 250W graphics cards. Along with built-in ignition control, it's feasible for vehicle deployment and operate via the car's electrical system.

Nuvo-8208GC features Neousys' patented heat dissipation design (* R.O.C Patent No. M534371) which can effectively dissipate the heat generated by GPU, so it can function under 100% load and wide temperature settings ranging from -25°C to 60°C.

Paired with Neousys' damping brackets and patent-pending GPU press bar, Nuvo-8208GC can be securely positioned and withstand various harsh conditions.

Nuvo-8208GC features front-accessible I/O design. It has 2x GbE, 4x USB3.1 Gen2, 4x USB3.1 Gen1, 1x UBS2.0, 1x VGA, 1x DVI-D, 1x DisplayPort, and 2x COM. USB 3.1 Gen1/ Gen2 ports feature screw-lock mechanisms for securing cable connections. In addition, Nuvo-8208GC incorporates two hot-swappable 2.5" trays for easy HDD/ SSD replacement and an M.2 2280 NVMe socket for the ultimate disk performance.

1.1 Product Specifications

1.1.1 Nuvo-8208GC Specifications

System Core		
-	Supporting Intel® Xeon® E and 8 th / 9 th Gen Coffee Lake CPU (LGA1151	
	socket)	
	Intel® Xeon® Processor E-2176G	
Processor	Intel® Xeon® Processor E-2124G	
F10Ce3301	Intel® Core™ i7-9700E/ i7-9700TE	
	Intel® Core™ i7-8700/ i7-8700T	
	Intel® Core™ i5-9500E/ i5-9500TE	
	Intel® Core™ i5-8500/ i5-8500T	
Chipset	Intel® C246 Platform Controller Hub	
Graphics	Independent GPU via x16 PEG port, or integrated Intel® UHD Graphics	
N 4	630	
Memory	Up to 128 GB ECC/ non-ECC DDR4 2133 SDRAM (four SODIMM slots)	
AMT	Supports AMT 12.0	
TPM	Supports TPM 2.0	
I/O Interface		
Ethernet	1x Gigabit Ethernet port by Intel® I219-LM	
	1x Gigabit Ethernet port by Intel® I210-IT	
	1x VGA connector, supporting 1920 x 1200 resolution	
Native Video	1x DVI-D connector, supporting 1920 x 1200 resolution	
	1x DisplayPort connector, supporting 4096 x 2304 resolution	
Serial Port	2x software-programmable RS-232/ 422/ 485 ports (COM1/ COM2)	
	4x USB 3.1 Gen2 (10 Gbps) ports	
USB	4x USB 3.1 Gen1 (5 Gbps) ports	
	1x USB 2.0 ports (internal for dongle use)	
Audio 1x speaker-out		
Storage Interfa	ce	
SATA	2x hot-swappable HDD trays for 2.5" HDD/ SSD installation	
M.2	1x M.2 2280 M key socket (PCIe Gen3 x4) for NVMe SSD or Intel® Optar	
	TM memory installation	
mSATA	2x full-size mSATA port (mux with mini-PCIe)	
Expansion Bus	5	
PCI Express	2x PCIe x16 slot@Gen3, 8-lanes	

2x PCIe x8 slots@Gen3, 4-lanes 1x PCIe x4 slot@Gen3, 1-lane 2x M.2 2242 B key socket with dual front-accessible SIM sockets,		
2x M.2 2242 B key socket with dual front-accessible SIM sockets.		
· · · · · · · · · · · · · · · · · · ·		
supporting dual SIM mode with selected M.2 LTE module		
2x full-size mini PCI Express socket		
2x 4-pin pluggable terminal block for 8~35V DC input and 1x 3-pin ignition		
control		
235 mm (W) x 360 mm (D) x 185.6 mm (H)		
-		
Wall-mounting with damping brackets		
-25°C ~ 60°C with 100% CPU/ GPU loading **/***		
-40°C ~85°C		
10%~90% , non-condensing		
Operating, MIL-STD-810G, Method 514.6, Category 4		
Operating, MIL-STD-810G, Method 516.6, Procedure I, functional		
shock=20g		
CE/ FCC Class A, according to EN 55024 & EN 55032		

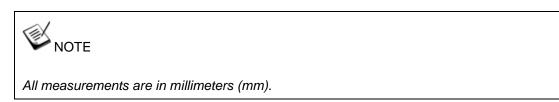

* The CPU and GPU loading are applied using Passmark® BurnInTest 8.0 with 35 TDP CPU. Operating

Temperature degrades with higher TDP CPU. For detail testing criteria, please contact Neousys Technology

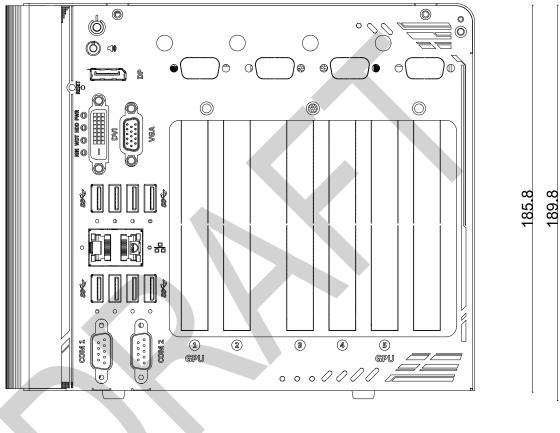

*** For sub-zero operating temperature, a wide temperature HDD drive or Solid State Disk (SSD) is required.

1.2.4 Nuvo-8208GC Hot-swap Panel View

1.2.5 Nuvo-8208GC Bottom View

2 System Overview

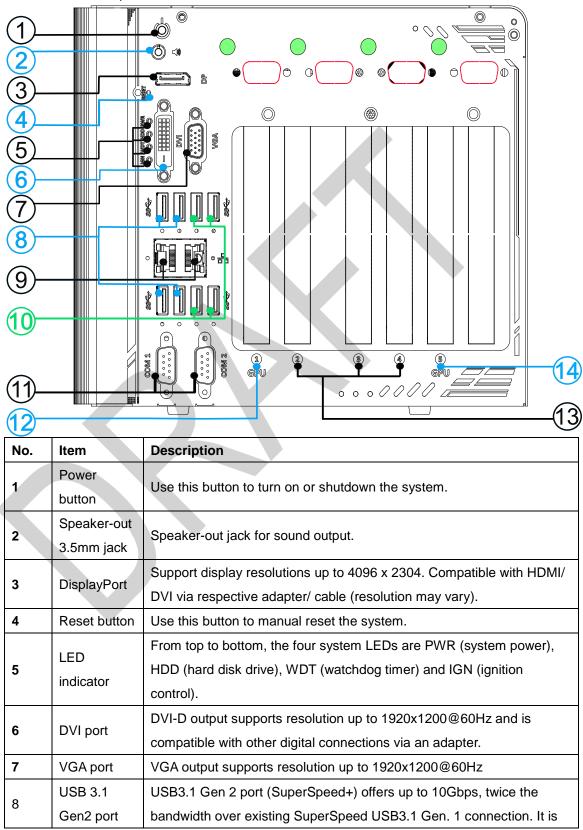

Upon receiving and unpacking your Nuvo-8208GC system, please check immediately if the package contains all the items listed in the following table. If any item(s) are missing or damaged, please contact your local dealer or Neousys Technology.

2.1 Nuvo-8208GC Packing List

System	Nuvo-8208GC	
Pack		
1	Nuvo-8208GC system	1
1	(If you ordered CPU/ RAM/ HDD, please verify these items)	1
	Accessory box, which contains	
	CPU bracket	1
	Neousys drivers & utilities DVD	1
	Wall-mount bracket	2
2	 Foot pad 	4
	 3-pin power terminal block 	2
	 HDD thermal pad for 2.5" HDD/SSD (if HDD is not installed) 	1
	Screw pack	1
	Rubber spacer	4

2.2 External I/O Panel

The Nuvo-8208GC I/O panel features Gen2/ Gen1 USB3.0, DisplayPort, DVI, VGA, dual Ethernet and COM ports.

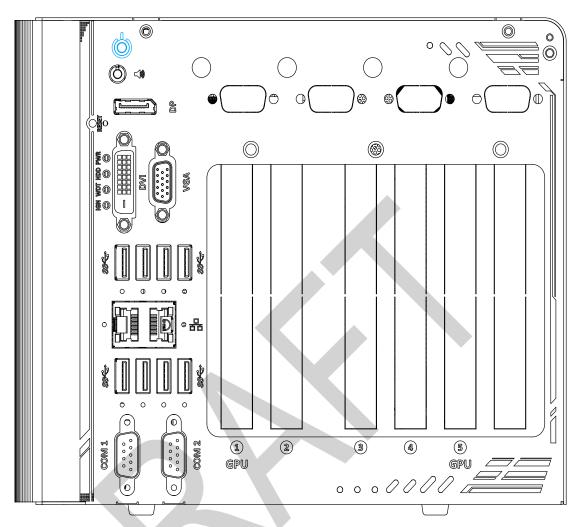

r						
		also backwards compatible with USB3.0 and USB2.0				
		1x Gigabit Ethernet port by Intel® I219-LM				
9	GbE port	1x Gigabit Ethernet port by Intel® I210-IT				
40	USB 3.1					
10	Gen1 port	USB3.1 Gen 1 offers up to 5Gbps of data-throughput performance				
44	COMpart	The software-selectable RS-232/422/485 ports. The operation mode of				
11	COM port	COM1 and COM2 can be set in BIOS.				
12	GPU slot	PCIe x16 slot @ Gen3, 8-lanes expansion slot				
40		2x PCIe x8 slots @ Gen3, 4-lanes expansion slot				
13	PCIe slots	1x PCIe x4 slot @ Gen3, 1-lane expansion slot				
14	GPU slot	PCIe x16 slot @ Gen3, 8-lanes expansion slot				
		Reserved antenna opening				
		Reserved DB9 connector opening				

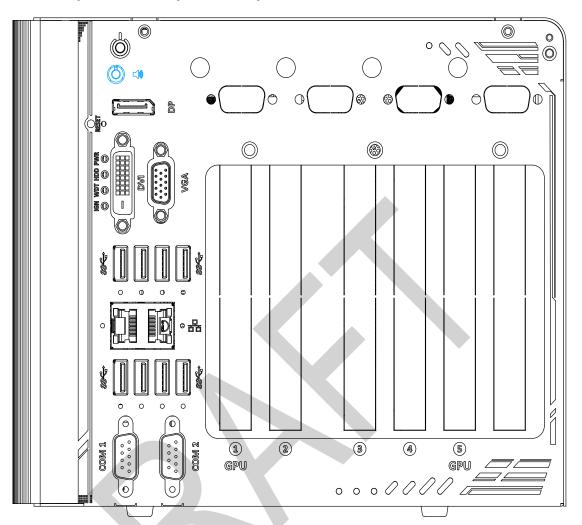

2.2.1 Power Button

The power button is a non-latched switch for ATX mode on/off operation. To turn on the system, press the power button and the PWR LED should light-up green. To turn off the system, issuing a shutdown command in OS is preferred, or you can simply press the power button. To force shutdown when the system freezes, press and hold the power button for 5 seconds. Please note that there is a 5-second interval between on/off operations (i.e. once the system is turned off, there is a 5-second wait before you can power-on the system).

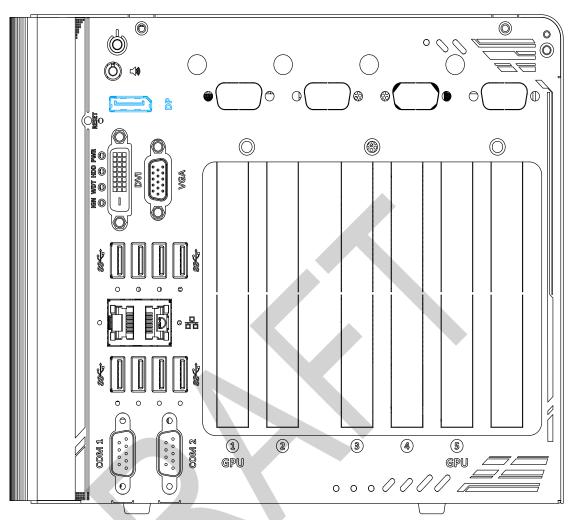

2.2.2 3.5mm Speaker/ Headphone Output Jack

The system audio function uses high definition audio. There is a female 3-pole \checkmark audio jack for headphone (speaker) output. To utilize the audio function in Windows, you need to install corresponding drivers for both Intel[®] C246 chipset and audio device drivers.

2.2.3 DisplayPort

The DisplayPort (DP) output is a digital display interface that mainly connect video source and carry audio to a display device. When connecting a DP, it can deliver up to 4K UHD (4096 x 2304) in resolution. The system is designed to support passive DP adapter/ cable. You can connect to other display devices using DP-to-HDMI cable or DP-to-DVI cable.

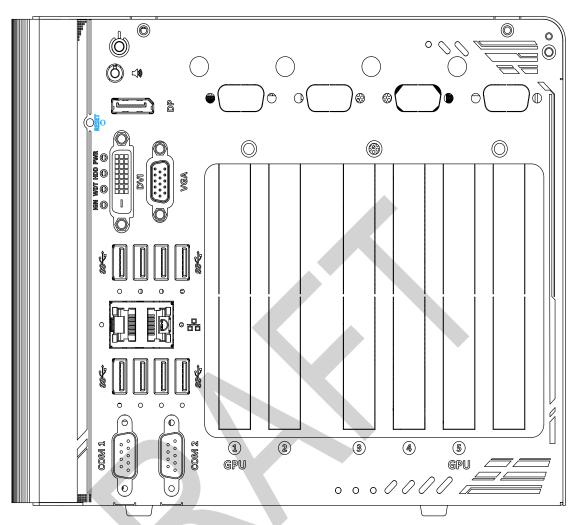

DP-to-HDMI

DP-to-DVI

The system supports triple independent display outputs by connecting display devices to VGA, DVI and DisplayPort connection. To support multiple display outputs and achieve best DisplayPort output resolution in Windows, you need to install corresponding graphics drivers. Please refer to section <u>OS Support and Driver Installation</u> for details.

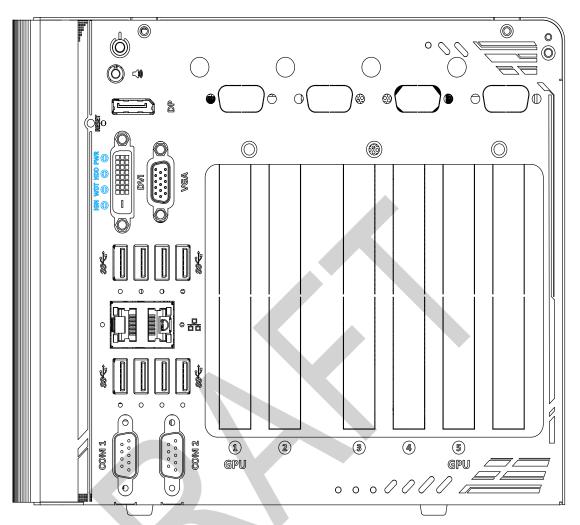

2.2.4 Reset Button

The reset button is used to manually reset the system in case of system halt or malfunction. To avoid unexpected reset, the button is purposely placed behind the panel. To reset, please use a pin-like object (eg. tip of a pen) to access the reset button

2.2.5 LED Indicators

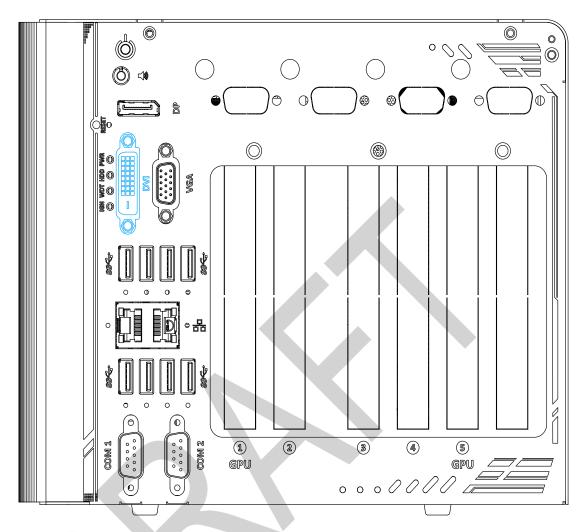

There are four LED indicators on the I/O panel: IGN, WDT, HDD and PWR. The descriptions of these four LED are listed in the following table.

Indicator	Color	Description		
PWR	Green	Power indictor, lid when system is on.		
HDD	Red	Hard drive indicator, flashing when hard disk drive is active.		
WDT	Yellow	Watchdog timer LED, flashing when WDT is active.		
IGN	Yellow	Ignition signal indicator, lid when IGN is high (12V/24V).		

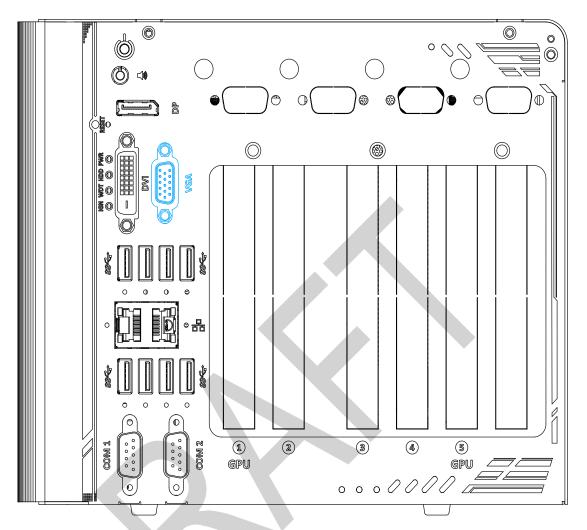

2.2.6 DVI Port

DVI-D transmits graphics data in digital format and therefore can deliver better image quality at high resolution. The DVI connector on the front panel can either output DVI signals or other digital signals (via an adapter/ cable) depending on the display device connected. It supports resolutions up to 1920x1200@60Hz.

The system supports triple independent display outputs by connecting display devices to VGA, DVI and DisplayPort. To support multiple display outputs and achieve best DVI output resolution in Windows, you need to install corresponding graphics driver. Please refer to section OS Support and Driver Installation for details.

2.2.7 VGA Port

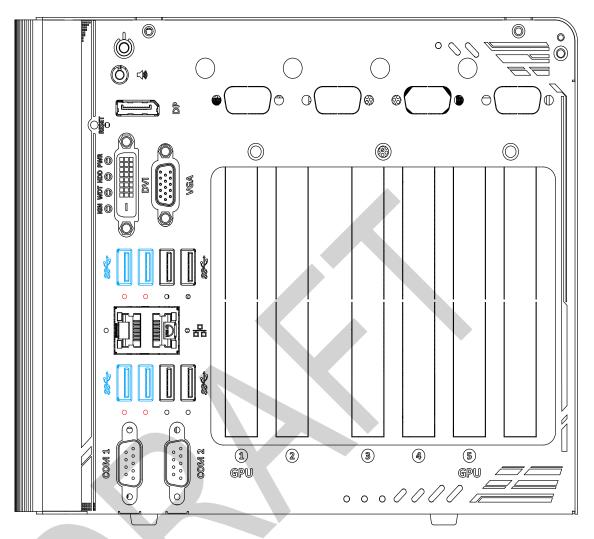

VGA connector is the most common video display connection. The VGA output supports up to 1920x1200@60Hz resolution.

The system supports triple independent display outputs by connecting display devices to VGA, DVI and DisplayPort. To support multiple display outputs and achieve best VGA output resolution in Windows, you need to install corresponding graphics drivers. Please refer to section <u>OS Support and Driver Installation</u> for details.

Please make sure your VGA cable includes SDA and SCL (DDC clock and data) signals for correct communication with monitor to get resolution/timing information. A cable without SDA/ SCL can cause blank screen on your VGA monitor due to incorrect resolution/timing output.

2.2.8 USB3.1 Gen 2 Port

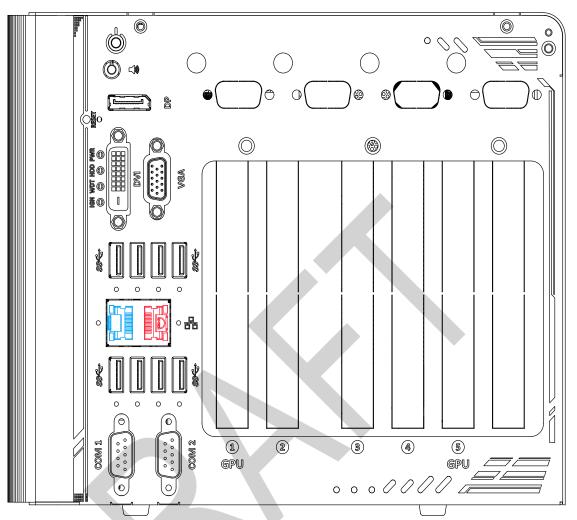

The system's USB 3.1 Gen 2 ports (10Gbps) are implemented via native xHCI (eXtensible Host Controller Interface) controller and are backward compatible with USB3.1 Gen.1 USB 2.0, USB 1.1 and USB 1.0 devices. Legacy USB is also supported so you can use USB keyboard/mouse in DOS environment. There are also screw-lock openings (indicated in red) for each USB port.

xHCI driver is supported natively in Windows 10, therefore you do not need to install xHCI driver in prior to utilize USB functions.

2.2.9 Gigabit Ethernet Port

The system offers 2 GbE ports on its I/O panel. The GbE ports are marked in **blue**/ **red** and are implemented with Intel[®] I219-LM/ Intel[®] I210-IT controllers, respectively. Each port has one dedicated PCI Express link for maximum performance. When an Ethernet connection is established, the LED indicators on the RJ45 connector represents the following connection statuses:

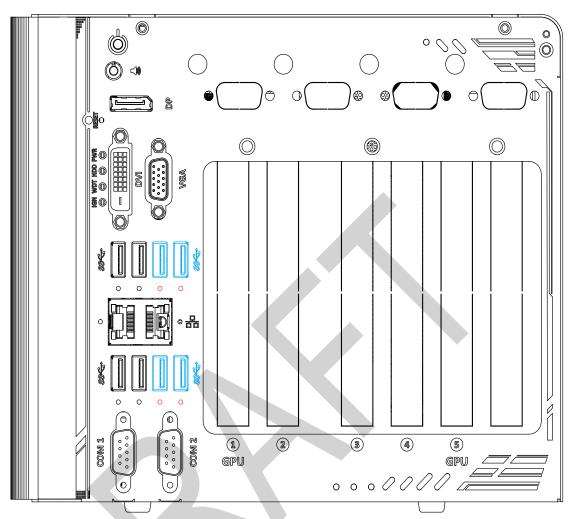

Active/Link LED

LED Color	Status	Description		
	Off	Ethernet port is disconnected		
Green	On	Ethernet port is connected and no data transmission Ethernet port is connected and data is transmitting/receiving		
	Flashing			
Speed LED				
LED Color	Status	Description		
Green or	Off	10 Mbps		
	Green	100 Mbps		
Orange	Orange	1000 Mbps		

The port implemented using Intel[®] I219-LM (in **blue**) supports Wake-on-LAN function. Drivers may be required to utilize the GbE port in Windows environment.

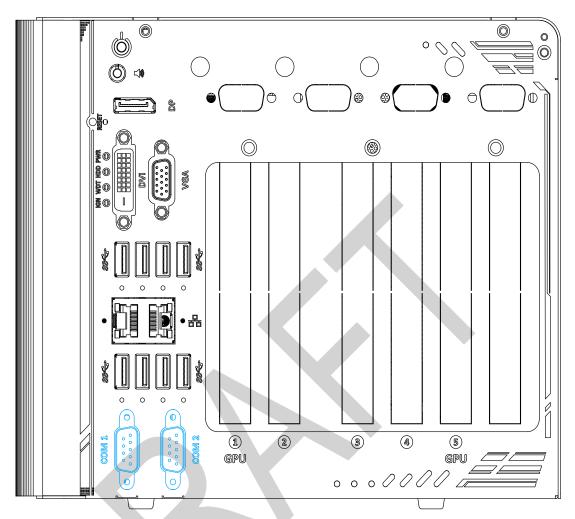

2.2.10 USB3.1 Gen 1 Port

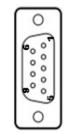

The system's USB 3.0 Gen 1 ports (5Gbps) are implemented via native xHCI (eXtensible Host Controller Interface) controller and are backward compatible with USB 2.0, USB 1.1 and USB 1.0 devices. Legacy USB is also supported so you can use USB keyboard/mouse in DOS environment. There are also screw-lock openings (indicated in red) for each USB port. xHCI driver is supported natively in Windows 10, therefore you do not need to install xHCI driver in prior to utilize USB functions.

2.2.11 COM Port

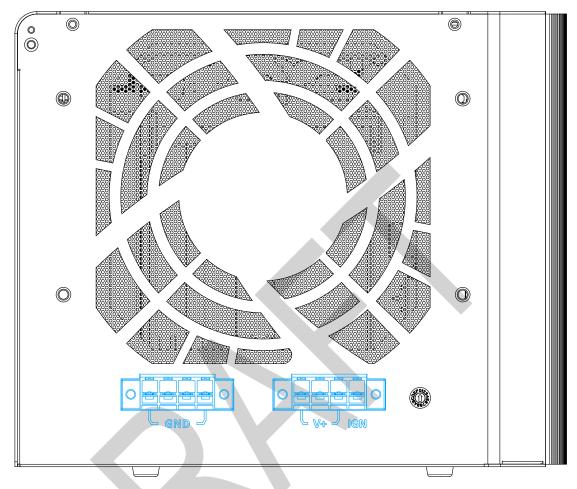

The two COM ports are implemented using industrial-grade ITE8786 Super IO chip (-40 to 85°C) and provide up to 115200 bps baud rate. COM1 and COM2 (in **red**) are software-configurable RS-232/422/485 ports. COM3 and COM4 (in **blue**) are standard 9-wire RS-232 ports. The operation mode of COM1 and COM2 can be set in BIOS setup utility. The following table describes the pin definition of COM ports.

	COM1 & COM2		
Pin#	RS-232 Mode	RS-422 Mode	RS-485 Mode
1	DCD		
2	RX	422 TXD+	485 TXD+/RXD+
3	ТΧ	422 RXD+	
4	DTR	422 RXD-	
5	GND	GND	GND
6	DSR		
7	RTS		
8	CTS	422 TXD-	485 TXD-/RXD-
9	RI		

COM Port Pin Definition

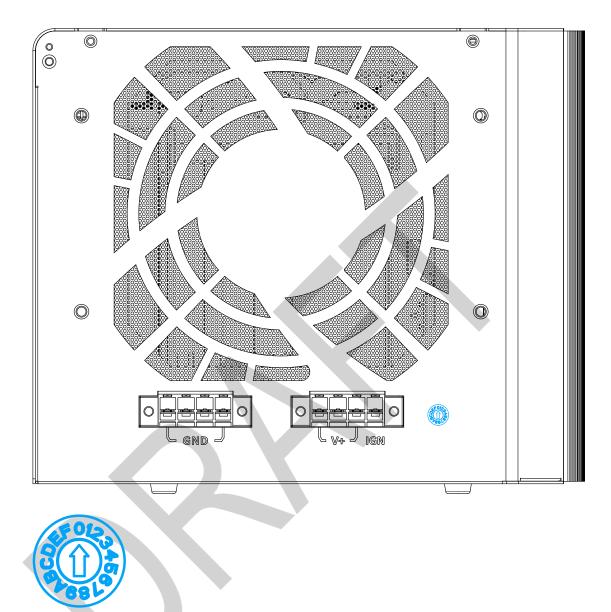

2.3 Ignition/ Dual 4-Pin Terminal Block

The system accepts a wide range of DC power input from 8 to 48V via dual 4-pin pluggable terminal block, which is fit for field usage where DC power is provided. The screw clamping mechanism on the terminal block offers connection reliability when wiring DC power. In addition to DC power input, this terminal block can also accept ignition signal input (IGN) for in-vehicle applications.

Please make sure the voltage of DC power is correct before you connect it to the system. Supplying a voltage over 48V will damage the system.

2.4 Ignition Control Switch

The ignition power control switch features multiple modes for pre and post ignition settings. Please refer to the section Ignition Power Control for details. Please use a flathead screwdriver to adjust the position of the ignition power control switch.

For details, please refer to the section Ignition Power Control for details

2.5 Internal I/O Functions

In addition to I/O connectors on the front panel, the system also provides internal on-board connectors, such as remote on/off control, LED status output, internal USB 2.0 ports, etc. In this section, we'll illustrate these internal I/O functions.

2.5.1 Dual SODIMM DRAM Slot

The system motherboard supports two 260-pin SODIMM socket for installing DDR4 memory module up to 64GB. Each slot supports single module DDR4 2666MHz SODIMM up to 32GB capacity.

When changes are made to DRAM module(s), such as additionally install or remove and reinstall (into the same/ different slot, it will result in an approximately 30~60 seconds delay when booting up for the first time after such change(s).

2.5.2 Dual Mode mSATA/ mini-PCIe Socket & Pin Definition

The system provides a dual mode mSATA/ mini-PCIe socket (indicated in **blue**) that is in compliance with mini-PCIe specification rev. 1.2. You can install either an mSATA SSD or mini-PCIe module into this socket and the system will automatically detect and configure it to run PCIe or SATA signals. This mini-PCIe socket is designed with SIM card (slot indicated in **red**) support. With a SIM card installed, your system can access the internet via your network provider's 3G/ 4G network.

For wireless (WIFI/ 3G/ 4G) communication, multiple SMA antenna apertures can be located on the front and rear panel.

47	Reserved	-	48	+1.5V	+1.5V	

Dual mode mSATA/ mini-PCle socket definition

49	Reserved	-	50	GND	GND
51	Reserved	-	52	3.3V	3.3V

Some off-the-shelf mini-PCIe 4G modules are not compliant to standard mini-PCIe interface. They use 1.8V I/O signals instead of standard 3.3V I/O and may have signal conflict. Please consult with Neousys for compatibility when in doubt!

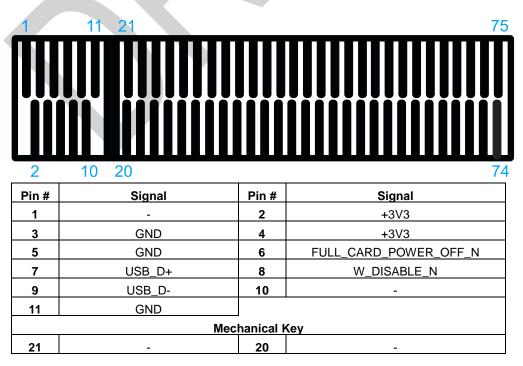

Installing an incompatible 4G module may damage the system or the module itself may be damaged.

2.5.3 M.2 2242 (B Key), Mini-SIM Card Slot & Pin Definition

The dual SIM card functionality is only available when Sierra Wireless EM7455/7430 solution is installed. For other 4G add-on solutions, SIM card slot 1 is the default functioning slot.

The system has anM.2 2242 slot (indicated in **blue**) that works with dual SIM slots (4G + 3G) on the front panel (indicated in **red**). By installing a 3G or 4G M.2 module and SIM card, you can access the internet via the provider's network.

For wireless 3G/4G, SMA antenna apertures are located on front/ rear panels.

2.5.4 SATA Ports

The system provides two SATA ports which support Gen3, 6 Gb/s SATA signals. Each SATA port (indicated in **blue**) features a 7-pin SATA connector and a 4-pin power connector.

The power connector (indicated in **red**) each accommodates a 2.5" HDD/ SSD in internal HDD bracket. Standard 22-pin SATA connectors are provided with the system. You may refer to the SATA Configuration section for SATA settings.

2.5.5 On/ Off Ctrl & Status Output

Pin#	Definition	Description
1	WDT_LED-	[Output] Watchdog timer indicator, flashing when Watchdog
2	WDT_LED+	timer is active
3	Standby Power-	[Output] Standby power indicator, on if DC power is applied
4	Standby Power+	and system is in S5 (standby) mode.
5	HDD-	[Output] Hard drive indicator, flashing when SATA hard
6	HDD+	drive is active.
7	Power-	[Output] System power indicator, on if system is turned on,
8	Power+	off if system is turned off.
9	Ctrl-	[Input] Remote on/off control, connects to an external
10	Ctrl+	switch to turn on/off the system (polarity is negligible).
11	IGN_LED-	[Output] Ignition control indicator, on if ignition control is on,
12	IGN_LED+	off if ignition control is off.

2.5.6 Internal USB 2.0 Port

The system's motherboard has an internal USB2.0 port on the PCBA. You can utilize this USB port to connect a USB protection dongle inside the chassis of the system.

2.5.7 M.2 2280 (M Key) Slot for NVMe SSD or Optane[™] Memory

The system has anx4 PCIe M.2 2280 slot (also in compliance with SATA signal) for you to

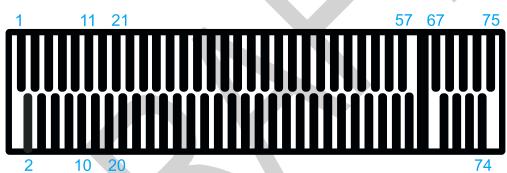

install an NVMe SSD for the ultimate performance or an Intel[®] Optane[™] memory to accelerate the read/ write performances of traditional hard disk drive. An NVMe SSD offers exceptional performance over 2.5" SSDs while Intel[®] Optane[™] memory can dramatically boost your traditional hard disk drives' read/ write performances.

The M.2 slot will automatically detect and configure the slot to run PCIe or SATA signal depending on the installed device.

3 System Installation

Before disassembling the system enclosure and installing components and modules, please make sure you have done the following:

- It is recommended that only qualified service personnel should install and service this product to avoid injury or damage to the system.
- Please observe all ESD procedures at all times to avoid damaging the equipment.
- Before disassembling your system, please make sure the system has powered off, all cables and antennae (power, video, data, etc.) are disconnected.
- Place the system on a flat and sturdy surface (remove from mounts or out of server cabinets) before proceeding with the installation/ replacement procedure.

3.1 Disassembling the System

To access system internal components, the system needs to be disassembled. To disassemble the system enclosure, you need to remove the Cassette module and screws on both I/O panels.

- 1. Turn the system upside-down and remove the four screws at the bottom of the Cassette module.
- 2. Gently wiggle and separate the Cassette module from the system.
- 3. On the rear I/O panel, remove the hexa-screws indicated below.
- 4. Remove the rear I/O panel.
- 5. On the front I/O panel, remove the hexa-screws indicated below.
- 6. Remove the front I/O panel.
- 7. Gently lift the system's bottom panel.
- 8. Once the bottom panel has been removed, you should have access to the system's internal I/O interfaces.

3.2 Installing Internal Components

3.2.1 CPU Installation Procedure

- 1. To install the CPU, you will need to separate the heatsink and the motherboard.
- 2. To do so, remove the nine screws indicated below (if you are installing the CPU for the first time, you need not remove the screws indicated in **red** as they are not yet installed and the screws can be found in the accessory box).
- 3. Gently separate the motherboard from the heatsink, you'll see the CPU socket protective cover, place finger tips underneath the sign "REMOVE" for leverage and gently lift the cover.

With the protective cover removed, please be careful when handling the motherboard. DO NOT touch the pins in the LGA socket!

4. Remove the CPU from its container/ tray. Match the two notches on the side to the protrusions in the socket, gently lower the CPU into the socket.

5. Locate the CPU retention bracket from the accessory box. Place the retention bracket on the CPU and hold it in place.

- 6. Turn the motherboard around and secure the bracket by tightening two M3 P-head screws.
- 7. Remove all thermal pads' protective films on the heatsink.
- 8. With the four motherboard standoffs aligned, gently lower the motherboard onto the heatsink and secure the four screws. If you need to install other components, please refer to respective sections.
- 9. Once the motherboard has been installed, you're ready to secure the five screws that help the heatsink apply pressure to the CPU/ chipset die. You'll want to apply even pressure to the corners by gradually tightening each screw. Please refer to the recommended order when tightening the screws.
- 10. Reinstall the system panels and Cassette module when done.
- 11. If you need to install other components, please refer to respective sections.

3.2.2 DDR4 SO-DIMM Installation

There are two SO-DIMM memory slots (indicated in **blue**) on the motherboard that supports a total maximum of 64GB DDR4-2666. Please follow the procedures below to replace or install the memory modules.

- 1. Please refer to the section "Disassembling the System".
- 2. Locate the SODIMM memory module slots on the motherboard.
- 3. To install the memory module, insert gold fingers into the slot at 45-degree angle, push down on the memory module to clip the module into position.
- 4. Push the memory module down until it is clipped-in.

- 5. Repeat steps 3 and 4 to install the other module.
- 6. <u>Reinstall the system enclosure</u> and panel when done.

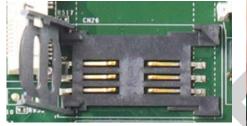

7. If you need to install other components, please refer to respective sections.

3.2.3 mPCIe Module, Mini-SIM (2FF) Card and Antennae Installation

The system has an mPCIe slot (indicated in **blue**)coupled with Mini-SIM socket (indicated in **red**)for installing 3G/ 4G module. For installation, please refer to the following instructions.

- 1. Please refer to the section "Disassembling the System".
- 2. Locate the mPCIe and SIM card slots on the motherboard.
- Before installing the mPCIe module, you need to insert the Mini-SIM card. Slide the SIM slot holder and lift the SIM card holder. Insert the Mini-SIM card (pins facing up), shut the SIM holder and slide it to lock the SIM card in-place.

Slide and lift SIM card holder

Insert Mini-SIM card with pins facing up

4. Secure the Mini-SIM card by sliding the holder.

5. Insert the mPCIe module on a 45 degree angle into the mPCIe slot and secure the module.

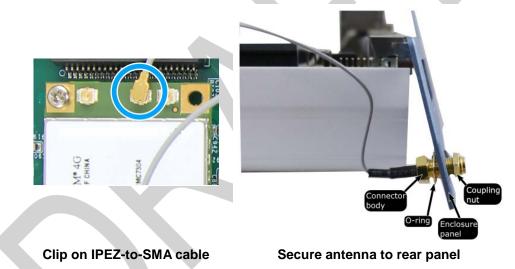

Insert on 45 degree angle

Secure the module

6. Clip on the IPEZ-to-SMA cable to the module and secure the antenna to the front or rear panel. Please refer to the module's manual for clip-on connection.

- 7. <u>Reinstall the system enclosure</u> and panel when done.
- 8. If you need to install other components, please refer to respective sections.

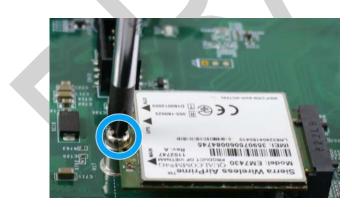

3.2.4 M.2 2242 (B Key) Module and Micro-SIM (3FF) Card Installation

The system has an M.2 slot (indicated in **blue**) for installing 3G/4G or a WiFi module that can be coupled with dual Micro-SIM card slots (indicated in **red**). For installation, please refer to the following instructions.

- 1. Please refer to the section "Disassembling the System".
- 2. Locate the M.2 2242 (B Key) and SIM card slots on the motherboard.
- 3. Insert the module on a 45 degree angle.

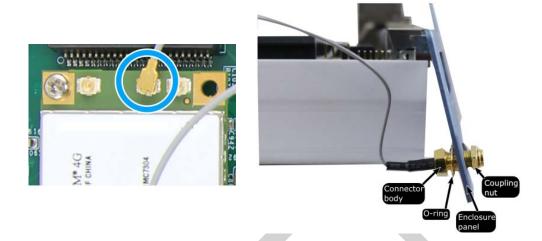

4. Gently press down and secure the module with an M2.5 P-head screw.

5. Clip on the IPEZ-to-SMA cable to the module and secure the antenna to the front or rear panel. Please refer to the module's manual for clip-on connection. If you need to install other components, please refer to respective sections.

Clip on IPEZ-to-SMA cable

Secure antenna to rear panel

- 6. With the motherboard exposed, the SIM card is inserted with the gold fingers facing downward. If you are inserting the SIM card with the system upright (heatsink fins upwards), the gold fingers should be facing upward. The SIM socket is a push-push type. The push-push mechanism means the SIM card is push-to-install and push-to-retrieve
- 7. <u>Reinstall the system enclosure</u> and panel when done.
- 8. If you need to install other components, please refer to respective sections.

3.2.5 M.2 2280 NVMe SSD or Intel[®] Optane[™] Memory Installation

The system has a x4 PCIe M.2 2280 slot for you to install an NVMe SSD for the ultimate performance or an Intel® Optane[™] memory to accelerate the read/ write performances of traditional hard disk drive. An NVMe SSD offers exceptional performance over 2.5" SSDs while Intel® Optane[™] memory can dramatically boost your traditional hard disk drives' read/ write performances. For installation, please refer to the following instructions.

- 1. Please refer to the section "<u>Disassembling the System</u>", you may not need to completely dismantle the system to gain access to the M.2 slot.
- 2. Insert the module on a 45 degree angle.

3. Gently press down and secure the module with an M2.5 P-head screw.

- 4. <u>Reinstall the system enclosure</u> and panel when done.
- 5. If you need to install other components, please refer to respective sections.
- 6. Please refer to the section <u>Intel[®] Optane[™] Memory BIOS Setup and Driver Installation</u> for traditional hard drive acceleration.

3.2.6 HDD/ SSD Installation

Supports up to 15mm thickness HDD/ SSD.

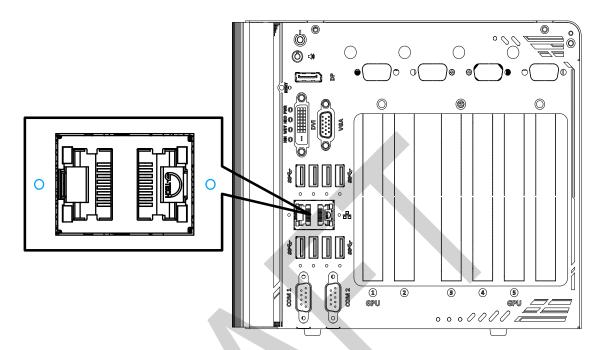

The system has two SATA ports (indicated in **blue**) and two four pin power connectors (indicated in **red**). The SATA and power cables should already be connected on the motherboard so users only need to install the HDD/ SSD. Please refer to the following instructions on how to install 2.5" SATA HDD/SSD.

- 1. Turn the system upside-down and remove the three screws indicated in the illustration below and lift the tray out of the system.
- 2. Take the HDD/ SSD thermal pad out of the accessory box and place it in the middle of the tray. Remove the protective film covering the HDD/ SSD thermal pad.
- 3. Place the HDD/ SSD (with labels facing up) and match the SATA connector end to the side with two screw holes (indicated in **blue**), secure the HDD/ SSD with the supplied flathead screws (4 per drive).
- 4. At the tray opening, you should be able to locate the 22-pin SATA cable, connect it to the installed HDD/ SSD.
- 5. Gently put the tray back into the system with the connector side being inserted into the system first and secure the tray with three screws.
- 6. If you need to install other components, please refer to respective sections.

3.2.7 Ethernet/ PoE+ Port Panel Screw Fix

The system's RJ45 Ethernet ports have panel screw fix holes (indicated in **blue circles**) for a firm cable connection.

1. To install and make use to the panel screw fix connection, you must acquire panel screw fix cables such as the cable shown below.

2. Simply insert the RJ45 connector into the RJ45 port and secure the top and bottom screws using your fingers or a screw driver.

3.3 Graphics Card Installation

To reduce the risk of damage, **DO NOT** remove the graphics card from the antistatic bag before it is ready to be installed into the Cassette module!

The Cassette module provides a separated compartment to accommodate an add-on card. It compartmentalizes the heat generated and effectively manages thermal conditions of both the system and the add-on card. The modular design reduces the complexity of installing and replacing the add-on card in the fanless controller. The mechanical design creates a sealed wind tunnel to bring in cold air to the GPU and expels hot air via a system fan to offer the system extreme stability and reliability. To install a PCIe graphics card into the Cassette module, please refer to the following procedure:

- 1. Turn the system upside-down and remove the four screws.
- 2. Gently wiggle the Cassette module and separate it from the system enclosure.
- 3. Remove the screws to open the Cassette cover.
- 4. Remove the bezel cover(s).
- 5. Attach the three rubber stands (provided in the accessory box) to the positions indicated on the back of the graphics card and one (provided in the accessory box) on the inside of the Cassette module's cover.
- 6. Insert the graphics card into the PCIe slot while making sure the bezel is properly inserted into the notch, the card is secured in place with screw(s) and the 6-pin power is connected to the graphics card. A 6-pin to 8-pin cable is also provided and can be found in the accessory box.
- 7. If you need to remove the graphics card out of the Cassette module, remove the screws, disconnect the 6-pin connector and flip the white lever outwards to disengage the PCIe slot.
- 8. Once the graphics card has been installed, place and secure the cover back onto the Cassette module.
- 9. Gently lower the Cassette module onto the system, press firmly to ensure the PCIe slot is properly engaged and secure the Cassette module.

3.4 Installing the System Enclosure

- To reinstall the system enclosure, the bottom panel on top of the motherboard while making sure both sides are inserted into the heatsink (indicated in blue).
- 2. Install front/ rear panel and secure screws indicated in blue.
- 3. Gently lower the Cassette module onto the system enclosure, press firmly to ensure the PCIe slot is properly engaged.
- 4. Secure the screws indicated to complete the enclosure installation process.

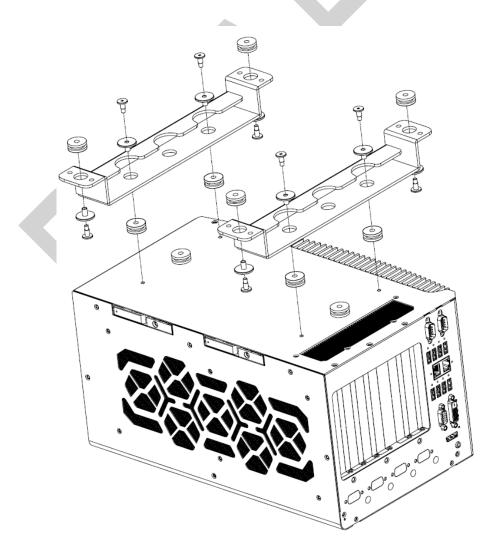

3.5 Wall-mount and Anti-vibration Damping Bracket Installation

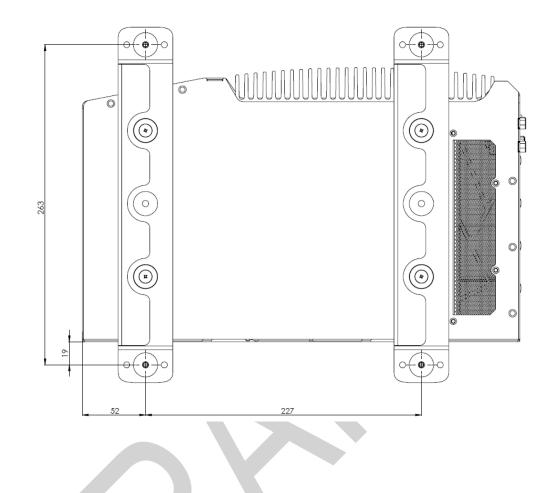

You will need to remove the four (4) rubber stands at the bottom of the enclosure if they have been attached.

The wall-mount and damping bracket offers superior operating vibration resistance up to 1Grm with HDD or up to 5Grm with SSD. Please refer to the Nuvo-8208GC exploded illustration below on installing damping brackets and wall-mounts. The brackets, damping brackets and screws can all be found in the accessory box.

 Take out anti-vibration damping bracket, eight (8) M4 screws, eight (8) sleeves and ten (10) anti-vibration grommets from the accessory box. Insert the M4 screws into the sleeves and through the anti-vibration grommets to secure the system to the bracket; and the bracket to a flat surface.

2. Place the system on a flat surface and secure it with screws.

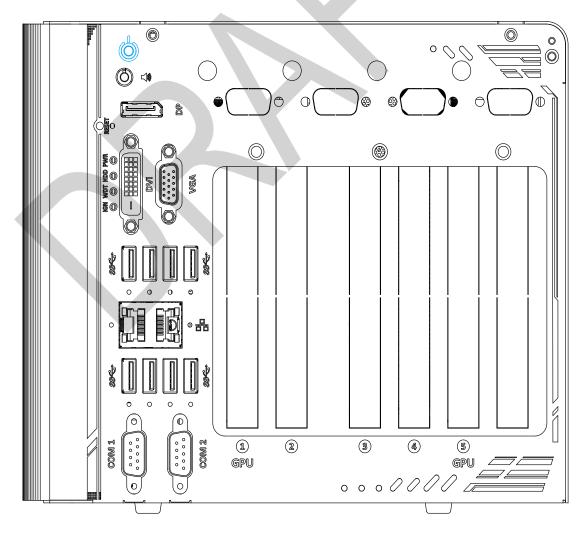

3.6 **Powering On the System**

There are three methods to power on the system

- Pressing the power button
- Sending a LAN packet via Ethernet (Wake-on-LAN)
- Powering on via ignition control (please refer to Ignition Control section)

3.6.1 Powering On Using the Power Button

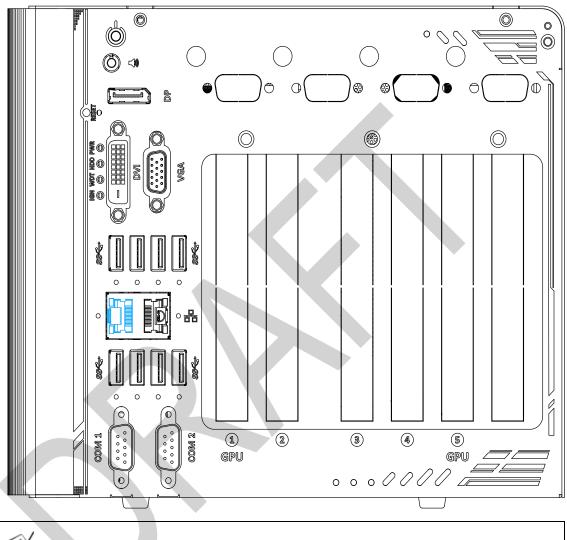

This is the simplest way to turn on your system. The power button is a non-latched switch and behaves as the ATX-mode on/off control. With DC power connected, pushing the power button will turn on the system and the PWR LED indicator will light up. Pushing the button when system is on will turn off the system. If your operating system supports ATX power mode (i.e. Microsoft Windows or Linux), pushing the power button while the system is in operation will result in a pre-defined system behavior, such as shutdown or hibernation.

3.6.2 Powering On Using Wake-on-LAN

Wake-on-LAN (WOL) is a mechanism to wake up a computer system from a S5 (system off with standby power) state via issuing a magic packet. The system's Wake-on-LAN compatible GbE port is shown below.

NOTE

Please make sure the Intel chipset and Ethernet driver has been properly installed prior to setting up WOL function.

To enable WOL function, please set up WOL settings in the BIOS and in the operating system by follow the steps described below.

- 1. When the system boots up, press F2 to enter BIOS setup utility.
- 2. Go to the [Power]>[Wake On LAN] and set it to [Enabled].
- 3. Press F10 to "**Save changes and exit BIOS**" and allow the system boot into the operating system.
- 4. Once booted into the Windows system, press "Windows key + E", right-click on

"Network>Properties>Change adapter settings". Locate and double-click on the adapter Intel® I219 Gigabit Network Connection, click on Configure...

 Click on the Power Management tab and check the following options. Click on OK when done.

Intel(R) Ethernet Connection (2) I219-LM Properties X						
Teaming General	VLANs Link Speed	Driver Advanced	Details Power Ma	Events anagement		
Power Saver and Wake on LAN Options

There are some free tools available on Internet that can be used to send a magic packet. Please refer to the following link to understand more about <u>Magic Packet</u>.

3.7 Ignition Power Control

The ignition power control module for in-vehicle applications is a MCU-based implementation that monitors the ignition signal and reacts to turn on/off the system according to predefined on/off delay. Its built-in algorithm supports other features such as ultra-low power standby, battery-low protection, system hard-off, etc. In this section, we'll illustrate the principle of ignition power control and operation modes.

3.7.1 Principles of Ignition Power Control

The basic concept of ignition power control module is to control the timing correlation between ignition signal and system power status. A typical timing correlation is described in following diagram.

DC IN	1		\$	\$
Ignition			<u> </u>	<u> </u>
Standby Power		<u> </u>	\$) <u>11</u>
PWRBTN#		<u> </u>	\$	§ 9
System ON		<u> </u>	\$	10
		(3)	()	8)

- When DC power is supplied to the system, MCU starts to periodically detect ignition signal. Note that only MCU is working at this moment and the overall power consumption is less than 2 mW.
- 2. Ignition signal is active (both 12VDC and 24VDC ignition signals are accepted).
- 3. MCU starts to count a pre-defined power-on delay.
- 4. Once power-on delay expired, MCU turns on necessary standby power for the system (3.3VSB & 5VSB).
- 5. A PWRBTN# pulse is then issued to turn on the system (equivalent to one pressing the power button on the front panel).
- 6. The system is booting and becomes operational.
- 7. After a period of time, the ignition signal becomes inactive.
- 8. MCU starts to count a pre-defined power-off delay.
- 9. Once power-off delay expired, another PWRBTN# pulse is issued to perform a soft-off for the system (ex. a normal shutdown process for Windows system).
- 10. The system is completely shut down.
- 11.As MCU detects system is off, it turns off the standby power for the system, and operates in low power mode again (< 2mW power consumption).

3.7.2 Additional Features of Ignition Power Control

In addition to the typical timing correlation, the ignition power control module offers additional features to provide additional reliability for in-vehicle applications.

1. Low battery detection

The ignition power control module continuously monitors the voltage of DC input when the system is operational. If input voltage is less than 9V (for 12VDC input) or less than 18V (for 24VDC input) over a 60-second duration, it will shut down the system automatically.

2. Guarded power-on/ power-off delay duration

If ignition signal goes inactive during the power-on delay duration, the ignition power control module will cancel the power-on delay process and go back to idle status. Likewise if ignition signal goes active during the power-off delay duration, the ignition power control module will cancel the power-off delay process and keep the system running.

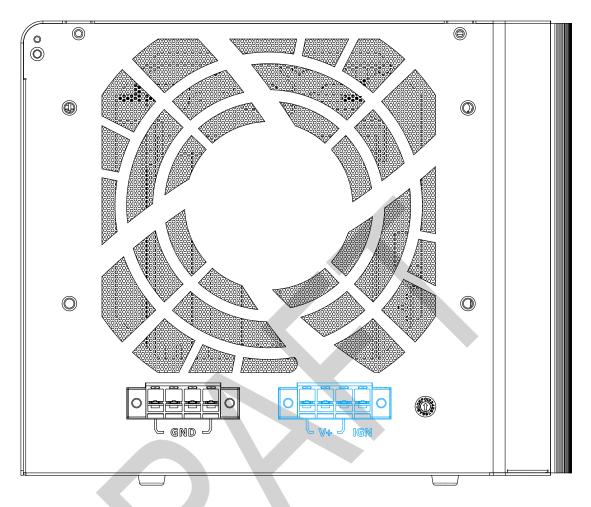

3. System hard-off

In some cases, system may fail to shutdown via a soft-off operation due to system/ application halts. The ignition power control module offers a mechanism called "hard-off" to handle this unexpected condition. By detecting the system status, it can determine whether the system is shutting down normally. If not, the ignition power control module will force cut-off the system power 10 minutes after the power-off delay duration.

4. Smart off-delay

The ignition power control module offers two modes (mode 13 & mode 14) which have very long power-off delay duration for applications require additional off-line time to process after the vehicle has stopped. In these two modes, the ignition power control module will automatically detect the system status during the power-off delay duration. If the system has shutdown (by the application software) prior to power-off delay expiring, it will cut off the system power immediately to prevent further battery consumption.

3.7.3 Wiring Ignition Signal

To have ignition power control for in-vehicle usage, you need to supply IGN signal to the system. The IGN input is located on the 4-pin pluggable terminal block (shared with DC power input). Below is the typical wiring configuration for in-vehicle applications.

- 1. Connect car Battery+ line (12V for sedan, 24V for bus/truck) to V+.
- 2. Connect car Batter-/ GND line to GND.
- 3. Connect ACC line to IGN.

Please make sure your DC power source and IGN signal share the same ground.

IGN input accepts 8~48VDC. Supply a voltage higher than 48VDC may damage the system.

3.7.4 Configure your Windows system

4

When applying ignition power control to your system, please make sure you've configured your Windows system to initiate a shutdown process when pressing the power button. By default, Windows 7/ 8/ 10 goes to sleep (S3) mode when power button is pressed. As sleep (S3) is not a complete shutdown behavior, the ignition control function does not recognize the finish of a normal shut down process and thus users will encounter a system hard-off (power cut-off after 10 minutes). Please configure "When I press the power button" to "Shut down" in your Windows system settings.

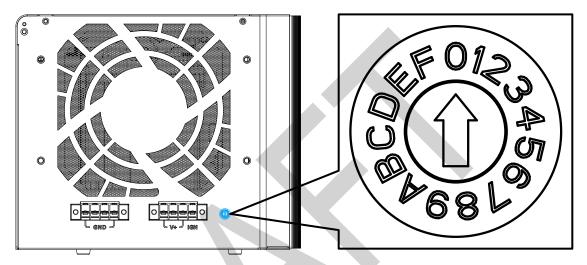

Power bu	utton settings	
0	When I press the power button:	Shut down 🔻
-		Do nothing
		Sleep
		Hibernate Shut down

3.7.5 Operation Modes of Ignition Power Control

You can use the rotary switch to configure the operation mode. The system offers 16 (0~15) operation modes with different power-on/power-off delay configurations.

The ignition control module is also BIOS-configurable. When rotary switch is set to mode 15 (0xF), the ignition power control is set to executed according to parameters configured in BIOS setup menu, which allows richer combination of power-on/ power-off delay and more detailed control parameters.

• Mode 0

Mode 0 is the ATX mode without power-on and power-off delay. User can only use the power button on the front panel to turn on or turn off the system.

Mode	Power-on Delay	Power-off Delay	Hard-off Timeout
0	N/A	N/A	N/A

Mode 1

Mode 1 is AT mode without power-on and power-off delay. The system automatically turns on when DC power is applied. A retry mechanism is designed to repeat the power-on cycle if the system fails to boot up.

Mode	Power-on Delay	Power-off Delay	Hard-off Timeout
1	N/A	N/A	N/A

Mode 2

Mode 2 is designed to have a very minor power on/ off delay of 160ms for applications that requires the system to start up almost at the same as the rest of the equipment it is working in collaboration with.

Mode	Power-on Delay	Power-off Delay	Hard-off Timeout
2	160ms	160ms	10 minutes

• Mode 3 ~ Mode 12

Mode	Power-on Delay	Power-off Delay	Hard-off Timeout
3	10 seconds	10 seconds	10 minutes
4	10 seconds	1 minute	10 minutes
5	10 seconds	5 minutes	10 minutes
6	30 seconds	1 minute	10 minutes
7	30 seconds	5 minutes	10 minutes
8	30 seconds	10 minutes	10 minutes
9	3 minutes	1 minute	10 minutes
10 (A)	3 minutes	10 minutes	10 minutes
11 (B)	3 minutes	30 minutes	10 minutes
12 (C)	10 minutes	30 minutes	10 minutes

Mode 3 ~ Mode 12 have various power-on delay and power-off delay. Each mode supports a hard-off timeout of 10 minutes.

• Mode 13 (D) / Mode 14 (E)

Mode 13 and Mode 14 are ignition power control modes with very long power-off delay. Both modes support the feature of "smart off-delay", which automatically detect system status during power-off delay duration and cut off system power if system is off in prior to power-off delay expired.

Mode	Power-on Delay	Power-off Delay	Hard-off Timeout
13 (D)	30 seconds	2 hours	10 minutes
14 (E)	3 minutes	2 hours	10 minutes

• Mode 15 (F)

The ignition control module is implemented to support BIOS-configurable ignition parameters. When the rotary switch is set to 15 (0xF), users can configure ignition parameters in BIOS setup menu.

To configure ignition parameters in BIOS, please follow the steps below.

- 1. Make sure you have set the rotary switch to position 15 (0xF).
- 2. When system boots up, press F2 to enter BIOS setup menu.
- 3. Go to [Power] \rightarrow [Ignition Power Control].

Power	r i i i i i i i i i i i i i i i i i i i
Ignition Power Control	
IGN Operation Mode	<atx></atx>
Smart Off-Delay	<enabled></enabled>
BIOS POST Check	<enabled></enabled>
Power On Delay	<10 Seconds>
Power Off Delay	<10 Seconds>
Hard-Off Timeout	<10 Minutes>
Battery Voltage	<12V Battery>
Low Battery Threshold	<9V>

4. You can configure parameters for ignition power control according to your application.

[IGN Operation Mode]

ATX	ATX mode without power-on and power-off delay. Same				
	operation as rotary switch set to 0.				
	Automatically turns on the system when DC power is applied				
	AUTO-ON	Same operation as rotary switch set to 1.			
	IGN	Ignition power control mode. Ignition control is executed			
	IGIN	according to the specified parameters.			

[Smart Off-Delay]

	If system is manually shutdown during the power-off delay			
Enabled	period, ignition control module will cut off system power in prior to expiration of power-off delay to save battery power.			
Dischlad	Ignition control module cut off system power only after			
Disabled power-off delay expired.				

[BIOS POST Check]

	This option secures a boot-to-OS operation. If the system is
Enabled	failed to boot to OS (e.g. disk failure or no bootable device)
	within 60 seconds, ignition control module will cut off system
	power and retry another power on cycle.
Disabled	BIOS POST check is skipped.

[Power On Delay]

Specifies the power-on delay duration. Once IGN signal goes active and sustains for the duration of power-on delay, ignition control module turns on system power and boot up the system.

[Power Off Delay]

Specifies the power-off delay duration. Once IGN signal goes inactive and sustains for the duration of power-off delay, ignition control module performs system shutdown (soft-off) and then cut off system power.

[Hard-off Timeout]

Specifies system hard-off timeout. Once system failed to normally shutdown via a soft-off operation due to system/application halts (e.g. Windows BSOD), ignition control module can compulsively cut off system power after the given hard-off timeout.

[Battery Voltage]

Specifies the battery voltage of the vehicle where System VTC is deployed. Typically it's 12 VDC for sedan and 24 VDC for bus/truck.

[Low Battery Threshold]

When system is running, ignition control module continuously monitors the battery voltage. Once the battery voltage is lower than the specified threshold, it performs system shutdown (soft-off) and cut off system power to prevent battery drain-out. You should specify the low battery threshold according to the given battery voltage.

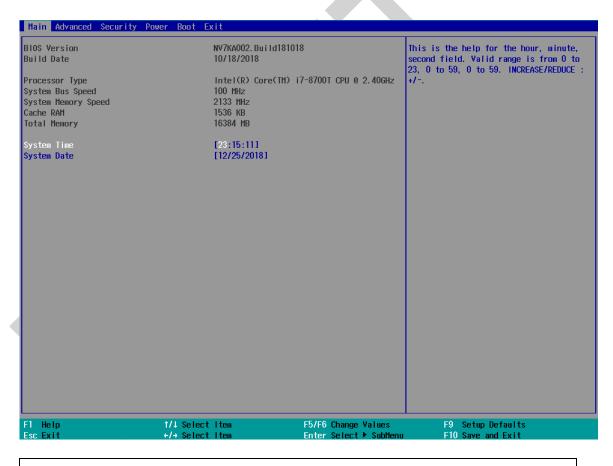

Press F10 to "Save Changes and Exit". The ignition control module will be reset and operate according to parameters configured in BIOS setup menu.

4 System Configuration

4.1 BIOS Settings

The system is shipped with factory-default BIOS settings meticulously programmed for optimum performance and compatibility. In this section, we'll illustrate some of BIOS settings you may need to modify. Please always make sure you understand the effect of change before you proceed with any modification. If you are unsure of the function you are changing, it is recommended to change one setting at a time to see its effect(s).

NOTE NOTE

Not all BIOS settings will be discussed in this section. If a particular setting/ function you are after requires specific BIOS settings but is not discussed in this section, please contact Neousys Technical Support staff.

4.1.1 COM Port Configuration

The system's <u>COM1/ COM2</u> ports support RS-232 (full-duplex), RS-422 (full-duplex) and RS-485 (half-duplex) mode. You can set the COM1 operating mode via BIOS settings. Another option in BIOS called "*Slew Rate*" defines how sharp the rising/falling edge is for the output signal of COM1. For long-distance RS-422/ 485 transmission, you may set the "*Slew Rate*" option as "High" to improve signal quality. For RS-422/485 communication, the "*RS-422/ 485 Termination*" option determines whether to enable/disable internal termination of RS-422/ 485 transceiver according to your wiring configuration (e.g. with or without external termination).

Peripheral Configuration			

To set COM port operating mode:

4

- 1. Press F2when the system boots up to enter the BIOS setup utility.
- 2. Go to [Advanced] \rightarrow [Peripheral Configuration].
- 3. Set the [Set COM1 Mode as] option to the desired mode.
- 4. Once set, press **F10** to save setting and exit.

4.1.2 COM Port High Speed Mode

The high speed mode of each COM port effectively allows for the port's baud rate generator to operate at 8x the speed with an effective baud rate of 921,600 bps (115,200 x 8). Please refer to the following instructions on how to enable the high speed mode for your COM port (COM1 used as an example).

Advanced			
Peripheral Configuration			Enable/Disable high-speed mode for COM1. When enabled, input clock for baud rate

To set COM port high speed mode:

- 1. Press **F2** when the system boots up to enter the BIOS setup utility.
- 2. Go to [Advanced] > [Peripheral Configuration].
- 3. Enable or set the [Set COM1 Mode as] option to the desired mode.
- 4. Highlight **[HS Mode]** and press ENTER to bring up options, highlight **[Enable]** and press ENTER.
- 5. Once set, press **F10** to save setting and exit.

4.1.3 Delay for PEG Initialization

This setting offers delay in milliseconds for PEG port initialization and PCI enumeration. By increasing the delay value, it may eliminate compatibility issue(s) with some PCIe add-on cards.

Advanced			
PEG Port Configuration x16 PEG Port Enable Root Port Max Link Speed	Not Present <enabled> <auto></auto></enabled>		Delay in milli-seconds for PEG port initialization and PCI enumeration. Increasing this value may help to eliminate compatibility issue with some PCIe add-on cards.
Delay for PEG Init	[100]	[Yes] [No]	
	†/↓ Select Item +/→ Select Item	F5/F6 Change Values Enter Select ► SubMenu	F9 Setup Defaults F10 Save and Exit

To set PEG delay in milliseconds:

- 1. When system boots up, press F2 to enter BIOS setup utility.
- Go to [Advanced] > [System Agent (SA) Configuration] > [PEG Port Configuration] > [Delay for PEG Init] and press ENTER.
- 3. A small window appears and you may enter a maximum delay value of up to 30,000ms.
- 4. When done, press F10 to "Exit Saving Changes"

4.1.4 SATA Configuration

The SATA controller of your system supports two (2) operating modes: AHCI and Intel RST Premium With Intel Optane System Acceleration mode. The AHCI mode, which exposes SATA's advanced capabilities such as hot swapping and native command queuing, is supported in several later version of operating systems. The Intel RST Premium With Intel Optane System Acceleration mode allows the user to greatly accelerate SATA hard drive read/ write speeds by installing an Optane memory into the M.2 slot. Please refer to the section "Intel RST Premium With Intel Optane System Acceleration" for details.

Advanced				
SATA And RST Configuration				Determines how SATA controller(s) operate.

F1 Help Esc Exit	↑/↓ Select +/→ Select		F5/F6 Change Values Enter Select ► SubMenu	F9 Setup Defaults F10 Save and Exit

Recommended SATA controller mode settings:

- If you're using Windows Vista, Windows 10, or Linux with kernel 4.15.18 or later, you can select **AHCI** mode for better performance.
- If you are looking for faster hard drive read/ write performance, please install an SSD (M.2, mPCle, SATA) or install an Intel[®] Optane[™] memory for hard drive acceleration.

To set SATA controller mode:

- 1. When system boots up, press F2 to enter BIOS setup utility.
- 2. Go to [Advanced] > [SATA Configuration].
- 3. Highlight the SATA, mSATA or M.2 port you wish to set and press ENTER to bring up setting options. Scroll to and highlight the setting you wish to set and press ENTER.

4.1.6 **TPM** Availability

Trusted Platform Module (TPM) is a hardware-based cryptoprocessor to secure hardware by integrating cryptographic keys into devices. The system is designed with on-board TPM 2.0 module. As TPM 2.0 requires 64-bit Windows 7/8/10 with UEFI boot mode, it is disable in BIOS by default. For customers who want to utilize TPM feature, you will need to enable TPM in BIOS as well as install Windows with UEFI mode.

To set "Power On after Power Failure" option:

- 1. When system boots up, press F2 to enter BIOS setup utility.
- 2. Go to [Power] > [Power On after Power Failure].
- 3. Scroll down to highlight [Power On after Power Failure], press ENTER to bring up setting options, S0 Power On or S5 Power Off, and press ENTER to select the setting.
- 4. Press F10 to "Exit Saving Changes".

4.1.9 Power & Performance (CPU SKU Power Configuration)

The system supports various 8th-Gen Coffee Lake LGA1151 CPUs. A unique feature, "**SKU Power Config**" is implemented in BIOS to allow users to specify user-defined SKU power limit. Although the system is designed to have best thermal performance with CPUs of 35W TDP, you can install a 65W CPU and limit its SKU power (to 35W) to obtain more computing power. This feature gives you the flexibility of CPU selection and great balance between computing power and operating temperature range.

Power		
Power & Performance		Configure SKU power limit according to
Processor Type Package TDP Limit	Intel(R) Core(TM) i7-8700T CPU @ 2.40GHz 35 W	performance consideration and operating environment.

To configure the CPU SKU power limit:

- 1. When the system boots up, press F2 to enter BIOS setup utility.
- 2. Go to [Power] \rightarrow [Power & Performance].
- 3. Select a proper value of SKU power limit for [SKU Power Config] option.
- 4. Press F10 to "Exit Saving Changes".

4.1.10 Wake on LAN Option

Wake-on-LAN (WOL) is a mechanism which allows you to turn on your System series via Ethernet connection. To utilize Wake-on-LAN function, you have to enable this option first in BIOS settings. Please refer "<u>Powering On Using Wake-on-LAN</u>" to set up the system.

4.1.12 Boot Type (Legacy/ UEFI)

The system supports both Legacy and Unified Extensible Firmware Interface (UEFI) boot modes. UEFI is a specification proposed by Intel to define a software interface between operating system and platform firmware. Most modern operating systems, such as Windows 7/8/10 and Linux support both Legacy and UEFI boot modes. The Legacy boot mode uses MBR partition for disk and VBIOS for video initialization, the UEFI boot mode uses GPT partition which supports greater than 2TB partition size and GOP driver for faster video initialization.

	Last Auto	

4. Once set, press **F10** to save setting and exit.

4.1.14 Watchdog Timer for Booting

The watchdog timer secures the boot process by means of a timer. Once the timer expires, a reset command is issued to initiate another booting process. There are two options in BIOS menu, "*Automatically after POST*" and "*Manually after Entering OS*". When "*Automatically after POST*" is selected, the BIOS automatically stops the watchdog timer after POST (Power-On Self Test) OK. When "*Manually after Entering OS*" is selected, the user must stop the watchdog timer once booted into the OS. This guarantees the system can always boot into the OS, otherwise another booting process will be initiated. For information about programming watchdog timer, please refer to <u>Watchdog Timer & Isolated DIO</u>.

To set the watchdog timer for boot in BIOS:

- 1. When system boots up, press F2 to enter BIOS setup utility.
- 2. Go to [Boot] menu.
- 3. Disable or select timeout value for **[WDT for Booting]** option.
- 4. Once you give a timeout value, the **[WDT Stop Option]** option appears. You can select *"Automatically after POST"* or *"Manually after Entering OS"*.
- 5. Press F10 to "Exit Saving Changes.

4.1.15 Legacy/ UEFI Boot Device

When you wish to set a designated boot device, you may set it as the first device to boot in Legacy or UEFI Boot Device setting. Or if you wish to manually select a boot device, you may do so by pressing F12 when the system boots up.

To set boot order for devices in UEFI Boot Device:

- 1. When system boots up, press F2 to enter BIOS setup utility
- 2. Go to [Boot] > [UEFI Boot Device]
- 3. Highlight the device you wish to make boot order changes to and press F5/ F6 or +/ to change device boot order.

To select boot order for devices in Legacy Boot Device:

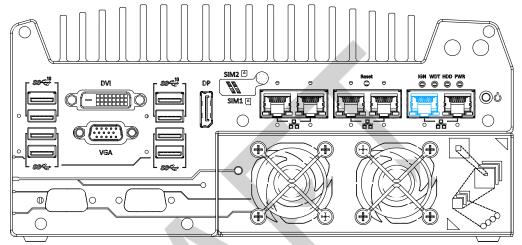

- 1. When system boots up, press F2 to enter BIOS setup utility
- Go to [Boot] > [Legacy Boot Device], you can choose the type of device to list by selecting "By Device or By Device Type".
- 3. Highlight the device you wish to make boot order changes to and press F5/ F6 or +/ to change device boot order.

4.2 AMT Configuration

Intel® AMT (Active Management Technology) is a hardware-based technology for remotely managing target PCs via Ethernet connection. The system supports AMT function via its Ethernet port implemented with Intel I219-LM. Prior to using the AMT function to remotely control the system, you need to configure AMT password and network settings.

1. Connect Ethernet cable tol219-LM Ethernet port(indicated in blue).

2. When the system boots up, press F10 to enter the MEBx configuration menu.

	Copyright	Engine BIOS Extension v11.0.0. (C) 2003-15 Intel Corporation.	All Rights Reserved	
		MAIN MENU

l	Intel(R) ME Password			
[†↓]=M	ove Highlight	[Enter]=Select Entry	[Esc]=Exit	

3. Highlight MEBx Login and press Enter, a prompt will appear asking for password. The default password is "admin". For further MEBx configuration details, please refer to Intel® MEBX User Guide.

4.3 RAID Configuration

To set up a RAID 0 or 1 volume in Legacy or UEFI mode, you need to have at least two hard drives or SSDs installed. The system supports RAID configurations in RAID 0 (striping) or RAID 1 (mirror) mode. Users can select the configuration that best suit their needs with RAID 0 (striping) mode offering better hard drive read/ write performances while RAID 1 (mirror) offers better data security.

Please back up hard drive data before you create or modify RAID volume(s) as the process may cause irreversible data deletion. When creating a RAID volume, it is also recommended to use hard drives from the same batch (same brand, model, capacity, rpm rate, etc.) to avoid performance or capacity allocation issues.

4.3.1 Legacy Mode RAID Configuration

To set up RAID configuration, you need to pre-configure the SATA mode setting in the BIOS. Please refer to the following steps:

- 1. When system boots up, press F2 to enter BIOS setup utility.
- Go to [Advanced] > [SATA And RST Configuration] > [SATA Mode Selection] > highlight [Intel RST Premium With Intel Optane System Acceleration] and press ENTER.

3. Go to [Boot] > highlight [Legacy Boot Type] and press ENTER to set boot type.

5 OS Support and Driver Installation

5.1 Operating System Compatibility

The system supports most operating system developed for Intel® x86 architecture. The following list contains the operating systems which have been tested by Neousys Technology.

- Microsoft Window 10 (x64)
- Fedora 29**
- Ubuntu 16.04.5 LTS** & Ubuntu18.04.0 LTS**

NOTE

For other Linux OS, Linux kernel should upgrade to 4.15.18.

*For Linux system, user may need to manually compile and install the driver for Intel graphics or I210 GbE controller if the driver is not embedded in kernel. You can visit Intel website for further information.

** For distributions, graphics driver and RAID function may not be completely implemented in its kernel. You may encounter restrictions when using these features, such as triple independent display and RAID. For optimum operation, it is the users' responsibility to manually check for new drivers and upgrades!

Neousys may remove or update operating system compatibility without prior notice. Please contact us if your operating system of choice is not on the list.

5.2 Driver Installation

The system comes with a "Drivers & Utilities" DVD that offers "one-click" driver installation process. It automatically detects your Windows operating system and installs all necessary drivers for you system with a single click.

5.2.1 Install Drivers Automatically

The system comes with a "Drivers & Utilities" DVD that offers "one-click" driver installation process. It automatically detects your Windows operating system and installs all necessary drivers for you system with a single click.

To install drivers automatically, please refer to the following procedures.

 Insert the "Drivers & Utilities" DVD into a USB DVD-drive connect to your system. A setup utility launches and the following dialog appears.

Click on "**Automatic Driver Installation**" and the setup utility will automatically detect your Windows operating system and install all necessary drivers. The installation process takes about 6~8 minutes depending on your Windows version. Once driver installation is done, the setup utility reboots your Windows and you may begin using your system.

5.2.2 Install Drivers Manually

You can also manually install each driver for the system. Please note when installing drivers manually, you need to install the drivers in the following sequence mentioned below.

Windows 10 (x64)

The recommended driver installation sequence is

- 1. Chipset driver (x:\Driver_Pool\Chipset_10_APL\Win_ALL\SetupChipset.exe)
- 2. Graphics driver (x:\Driver_Pool\Graphics_SKL_APL\Win_7_8_10_APL_64\Setup.exe)
- 3. Audio driver (x:\Driver_Pool\Audio_ALC262\Win_ALL_64\Setup.exe)
- LAN driver

 (x:\Driver_Pool\GbE_I210_I350\Win_ALL_64\APPS\PROSETDX\Win10_x64\DxSetup.e xe)
- 5. ME driver (x:\Driver_Pool\ME_10_Series\Win_ALL_AMT\SetupME.exe)

5.3 Driver Installation for Watchdog Timer Control

Neousys provides a driver package which contain function APIs for Watchdog Timer control function. You should install the driver package (WDT_DIO_Setup.exe) in prior to use these functions. Please note that you must install WDT_DIO_Setup_v2.2.9.x or later versions.

Windows 10 (x64)

Please execute the driver setup program in the following directory.

x:\Driver_Pool\WDT_DIO\Win7_8_64\WDT_DIO_Setup_v2.2.9.x(x64).exe

Windows 10 (WOW64)

Please execute the driver setup program in the following directory.

x:\Driver_Pool\WDT_DIO\Win7_8_WOW64\WDT_DIO_Setup_v2.2.9.x(wow64).exe

5.4 Intel[®] Optane[™] Memory BIOS Setup and Driver Installation

The system is compatible with Intel[®] Rapid Storage Technology that supports the installation of Intel[®] OptaneTM memory to significantly boost traditional hard disk drive read and write performances. Intel® OptaneTM memory is Intel® RST's latest system acceleration solution featuring a dual-media/disk combination (ultrafast media for file and block caching + slow media for storage capacity) that is presented to the host OS as a single SSD. The ultrafast media utilizes PCIe NVMe SSDs that are based on Intel® OptaneTM technology with read speed of up to 3000Mb/ sec and write speed of up to 2000Mb/ sec.

To setup Intel[®] Optane[™] memory, please perform the following steps:

- 1. Press the power button to startup your system (please restart if your system is already up and running) and press F2 to enter BIOS.
- 2. Go to "Advanced > SATA And RST Configuration".

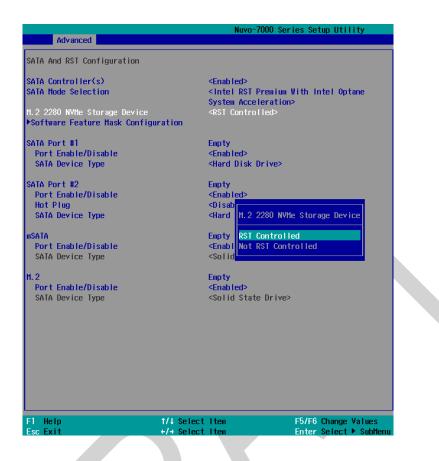

3. Go to "SATA Mode Selection", press the Enter key to bring up options, select "Intel RST Premium With Intel Optane System Acceleration" and press ENTER to select the option.

Advanced	Nuvo-7

4. Go to "M.2 2280 NVMe Storage Device" and press the Enter key to bring up the selection, select "RST Controlled" and press the Enter key to select the option.

- 5. Press F10 to save and exit, and allow the system to boot into Windows.
- 6. In Windows, download Intel® RST driver if you don't already have it on hand. Right-click

on the SetupOptaneMemory.exe

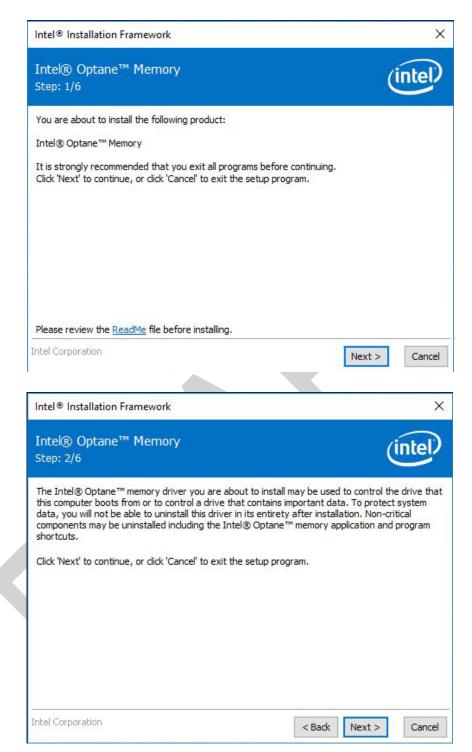

SetupOptane Memory

and left-click on "Run as administrator" to

execute the setup file.

7. Follow the 6 step setup procedure as instructed.

8. Check the "I accept the terms in the License Agreement" box and click on "Next >" to continue the installation process.

Intel® Optane™ Memory Step: 3/6	Intel® Installation Framework	>

Please wait while the product is being installed.	
Intel Corporation	

9. When done, click on "Finish" and restart the system.

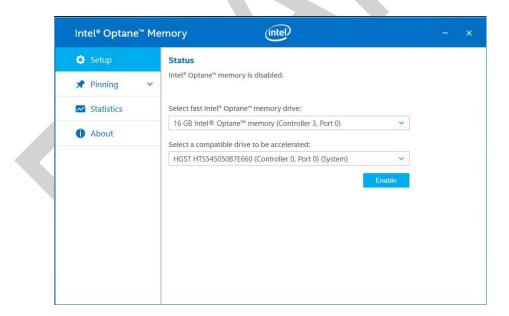

Intel(Step:	® Optane™ Memory 6/6	(inte
	You have successfully installed the following product: Intel® Optane™ Memory	
	Please restart your PC to implement these changes. Would you li now?	ke to restart your PC
	• Yes, I want to restart this computer now.	
	○ No, I will restart this computer later.	
	Note: A restart (not 'Shut down') is required to complete the insta	allation process.
Intel Co	rporation	Fini

10. Upon system restart, the following initialization screen will appear. Click on Next to continue.

 In the Setup section, you will see your Intel® Optane[™] memory drive and compatible drive(s) that can be accelerated. Click on the downward arrow to bring up a selection of drives to be accelerated. Click on "Enable" when ready.

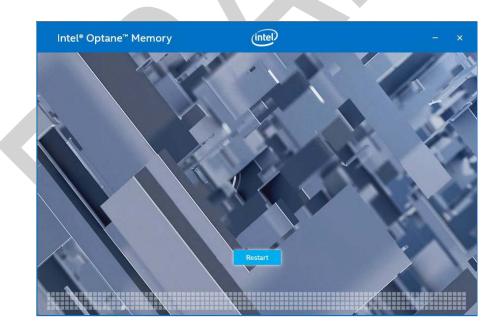

12. The data backup warning will appear, please backup any data you may have stored on your Intel® Optane[™] memory module before proceeding. Check the box "Erase all data on Intel® Optane[™] memory module" and click on Continue.

 When the Intel® Optane[™] memory module has been enabled, the installation window and a notification window at the bottom right corner will prompt you to restart the system.

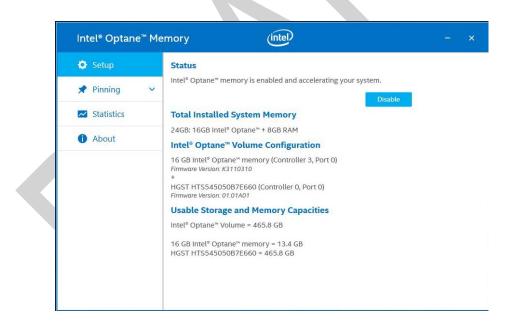

Intel® Optane™ Memory	×
Operation completed	
Please restart your computer to com	plete the process.
	Restart

 Upon system restart, a successful enablement message will appear to indicate the Intel® Optane[™] memory module has been enable successfully.

15. Once enabled, the RST software Setup section should show your configuration information.

Appendix A Using WDT & DIO

The watchdog timer (WDT) function to ensure reliable system operation. The WDT is a hardware mechanism to reset the system if the watchdog timer is expired. Users can start the WDT and keeping resetting the timer to make sure the system or program is running. Otherwise, the system shall be reset.

In this section, we'll illustrate how to use the function library provided by Neousys to program the WDT functions. Currently, WDT driver library supports Windows 10 x64 and WOW64 platform. For other OS support, please contact Neousys Technology for further information.

Installing WDT_DIO Library

The WDT_DIO function library is delivered in the form of a setup package named **WDT_DIO_Setup.exe**. In prior to program WDT, you should execute the setup program and install the WDT library. Please use the following WDT_DIO_Setup packages according to your operating systems and application.

- For Windows 10 64-bit OS with 64-bit application (x64 mode), please install WDT_DIO_Setup_v2.2.8.x(x64).exe or later version.
- For Windows 10 64-bit OS with 32-bit application (WOW64 mode), please install WDT_DIO_Setup_v2.2.8.x(wow64).exe or later version.

WDT and DIO Library Installation

To setup WDT & DIO Library, please follow instructions below.

1. Execute **WDT_DIO_Setup.2.2.8.x.exe**. and the following dialog appears.

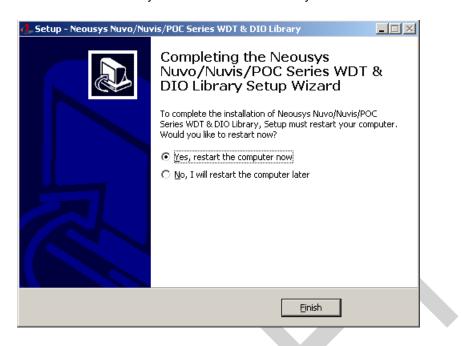

🦺 Setup - Neousys Nuvo/Nuv	vis/POC Series WDT & DIO Library	
	Welcome to the Neousys Nuvo/Nuvis/POC Series WDT & DIO Library Setup Wizard	
	This will install Neousys Nuvo/Nuvis/POC Series WDT & DIO Library version Ver. 2.0 on your computer.	
	It is recommended that you close all other applications befor continuing.	re
	Click Next to continue, or Cancel to exit Setup.	
	Next > Cance	!

 Click "Next >" and specify the directory of installing related files. The default directory is C:\Neousys\WDT_DIO.

🥠 Setup - Neousys Nuvo/Nuvis/POC Series WDT & DIO Library
Select Destination Location Where should Neousys Nuvo/Nuvis/POC Series WDT & DIO Library be installed?
Setup will install Neousys Nuvo/Nuvis/POC Series WDT & DIO Library into the following folder.
To continue, click Next. If you would like to select a different folder, click Browse.
C:\Neousys\WDT_DIO Browse
At least 5.6 MB of free disk space is required.
< <u>B</u> ack <u>N</u> ext > Cancel

 Once the installation has finished, a dialog will appear to prompt you to reboot the system. The WDT & DIO library will take effect after the system has rebooted.

4. When programming your WDT or DIO program, the related files are located in

WDT Functions

InitWDT

	1		
Syntax	BOOL InitWDT(void);		
Description:	Initialize the WDT function. You should always invoke InitWDT() before set or start watchdog timer.		
Parameter	None		
Return Value	TRUE: Successfully initialized		
	FALSE: Failed to initialize		
Usage	BOOL bRet = InitWDT()		
г			

SetWDT

Γ			
Syntax	BOOL SetWDT(WORD tick, BYTE unit);		
Description	Set timeout value and unit for watchdog timer. When InitWDT()		
	is invoked, a default timeout value of 255 seconds is assigned.		
	tick		
Parameter	WORD value (1 ~ 65535) to indicate timeout ticks.		
	unit		
	BYTE value (0 or 1) to indicate unit of timeout ticks.		
	0 : unit is minute		
	1: unit is second		
Return Value	If value of unit is correct (0 or 1), this function returns TRUE,		
Return value	otherwise FALSE.		
	WORD tick=255;		
Usage	BYTE unit=1; //unit is second.		
	BOOL bRet = SetWDT(tick, unit); //timeout value is 255		
	seconds		

StartWDT

Syntax	BOOL StartWDT(void);		
Description	Starts WDT countdown. Once started, the WDT LED indicator will begin blinking. If ResetWDT() or StopWDT is not invoked before WDT countdowns to 0, the WDT expires and the system resets.		
Parameter	None		
Return Value	If the timeout value is given in correct format (WDT started), this function returns TRUE, otherwise FALSE		
Usage	BOOL bRet = StartWDT()		
/DT			
•			

ResetWDT

Neselw		
	Syntax BOOL ResetWDT(void);	
	Description	Depart the timperut value to the value given by SetM(DT() If
	Description	Reset the timeout value to the value given by SetWDT().If
		ResetWDT() or StopWDT is not invoked before WDT
		countdowns to 0, the WDT expires and the system resets.
	Parameter	None
	Return Value	Always returns TRUE
	Usage	BOOL bRet = ResetWDT()
StopWD	т	
	Syntax	BOOL StopWDT(void);
	Description	Stops the countdown of WDT. When WDT has stopped, the WDT LED indicator stops blinking.

Parameter	None
Return Value	Always returns TRUE
Usage	BOOL bRet = StopWDT()
